HELIXONA

eClinicalWorks bot flows

What Helixona is building, where the bot fits, and the five flows to build. Prepared for Kai, October 2026.

THE PROJECT

A patient platform next to the clinic's medical record

Helixona is an integrative medicine clinic in Irvine, California. Its flagship offer is the **Complex Chronic Program**: a nine-month, physician-led program for people with persistent fatigue, autoimmune conditions, Lyme, mold illness, long COVID and similar complex problems. The clinic also offers **Health Optimization** care and single therapies (salt room, nano bath, red light, IV therapy) that anyone can book.

The clinic's medical record is **eClinicalWorks (eCW)**. It stays the legal chart and the calendar for insurance visits. But it handles the program badly: long intake questionnaires, signed consents, daily check-ins, alerts to the nurses, memberships and recurring payments, and bookings of rooms and devices. Helixona is building its own patient platform for those things.

Patients, on their phone

Website inquiry, intake questionnaire, consents with e-signature, daily health check-in, crash or flare reports, booking sessions, paying the membership.

Staff, on desktop

Advisors qualify inquiries, Charlene prepares charts, nurses work the alert queue, Karina runs memberships and payments, the physician approves clinical content.

eClinicalWorks

Keeps the chart and the clinic calendar. Receives a copy of what the platform produces, so nobody double-enters data.

Where the bot comes in. eCW offers no interface we can use. So a bot, signed in as its own eCW user, does what Charlene and the front desk do by hand today: it places the intake note and PDF in the chart, mirrors bookings into the calendar, and reads the calendar back every morning. It is a careful clerk, not a decision maker.

1. **Inquiry and screening.** The patient applies on the website; an advisor calls and qualifies them.
2. **Intake.** The patient completes the questionnaire and signs the consents in the platform. Charlene reviews. **The bot (J1, J2)** verifies the chart and places the note and PDF in eCW.

3. **Assessment and plan of care.** Month 0 with the physician. Booked in eCW by staff; the platform shows it read-only via **J4**.
4. **Active care.** The patient books sessions and reports daily. **The bot (J3, J5)** keeps a copy of every booking in eCW.
5. **Treatment-only visitors.** People who just book a salt room or IV get the same booking copy (**J3**) once they have a chart.

GROUND RULES

How the bot behaves, whatever the job

- **Own user.** The bot signs in as "HLX Bot". Every line it writes carries the prefix **HLX**, so staff can always tell bot entries from human ones.
- **Never clinical.** It never chooses, edits or deletes clinical content. It copies what a human already approved in the platform.
- **Check before writing.** It confirms it is on the right patient (name and date of birth) and that the item is not already there. No duplicates, ever.
- **Check after writing.** After every write it reopens the record and confirms what it wrote. Only then does the platform show "placed in eCW" or "confirmed".
- **When unsure, stop and ask.** If it cannot confirm a write, it stops, takes a screenshot, and puts the item in the staff exception queue. No automatic retries after a write attempt.
- **Humans always have a manual path.** Charlene can still copy and paste; the front desk can still book in eCW. The bot removes work, not control.
- **Office hours only.** Writes between 6 AM and 10 PM Pacific, never during eCW maintenance.

THE FIVE FLOWS

One bot, five jobs

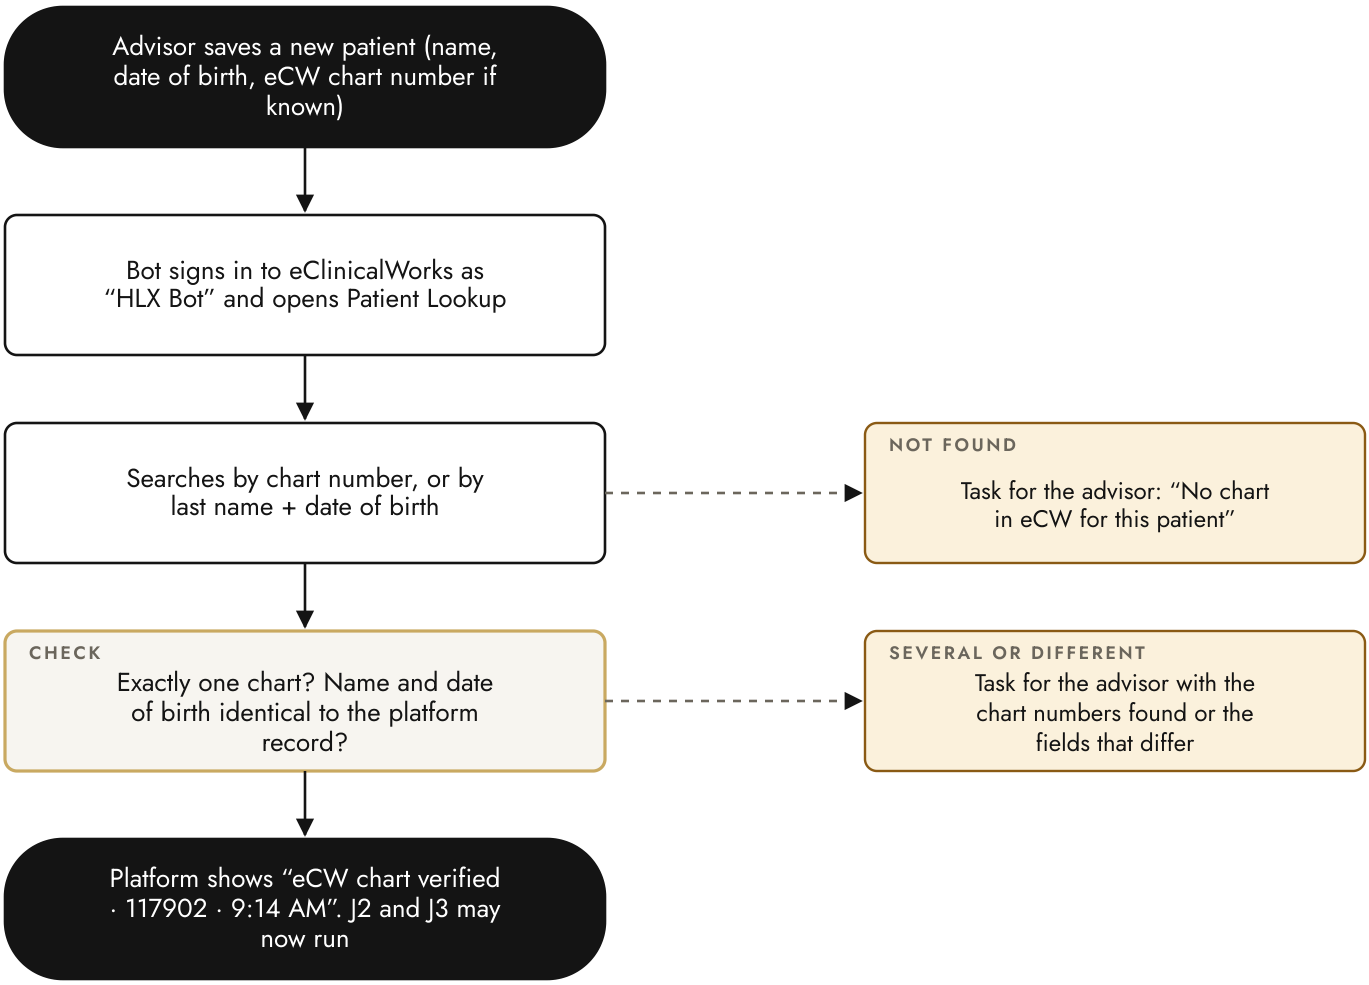

JOB	WHAT IT DOES	READS OR WRITES	WHEN
J1	Verify the patient's chart exists and matches	Reads	Advisor creates a patient
J2	Place the intake note and PDF in the chart	Writes	Intake marked ready for chart prep
J3	Copy a booking into the eCW calendar	Writes	Platform confirms a booking
J4	Read the calendar and reconcile	Reads	Every morning, 6:30 AM
J5	Move or cancel a copied booking	Writes	Booking changed in the platform

Start / finish · Bot step · Check · Writes to eCW · Goes to staff · Critical, stops

J1 Verify chart

READS ONLY — When a patient advisor creates a patient record in the platform

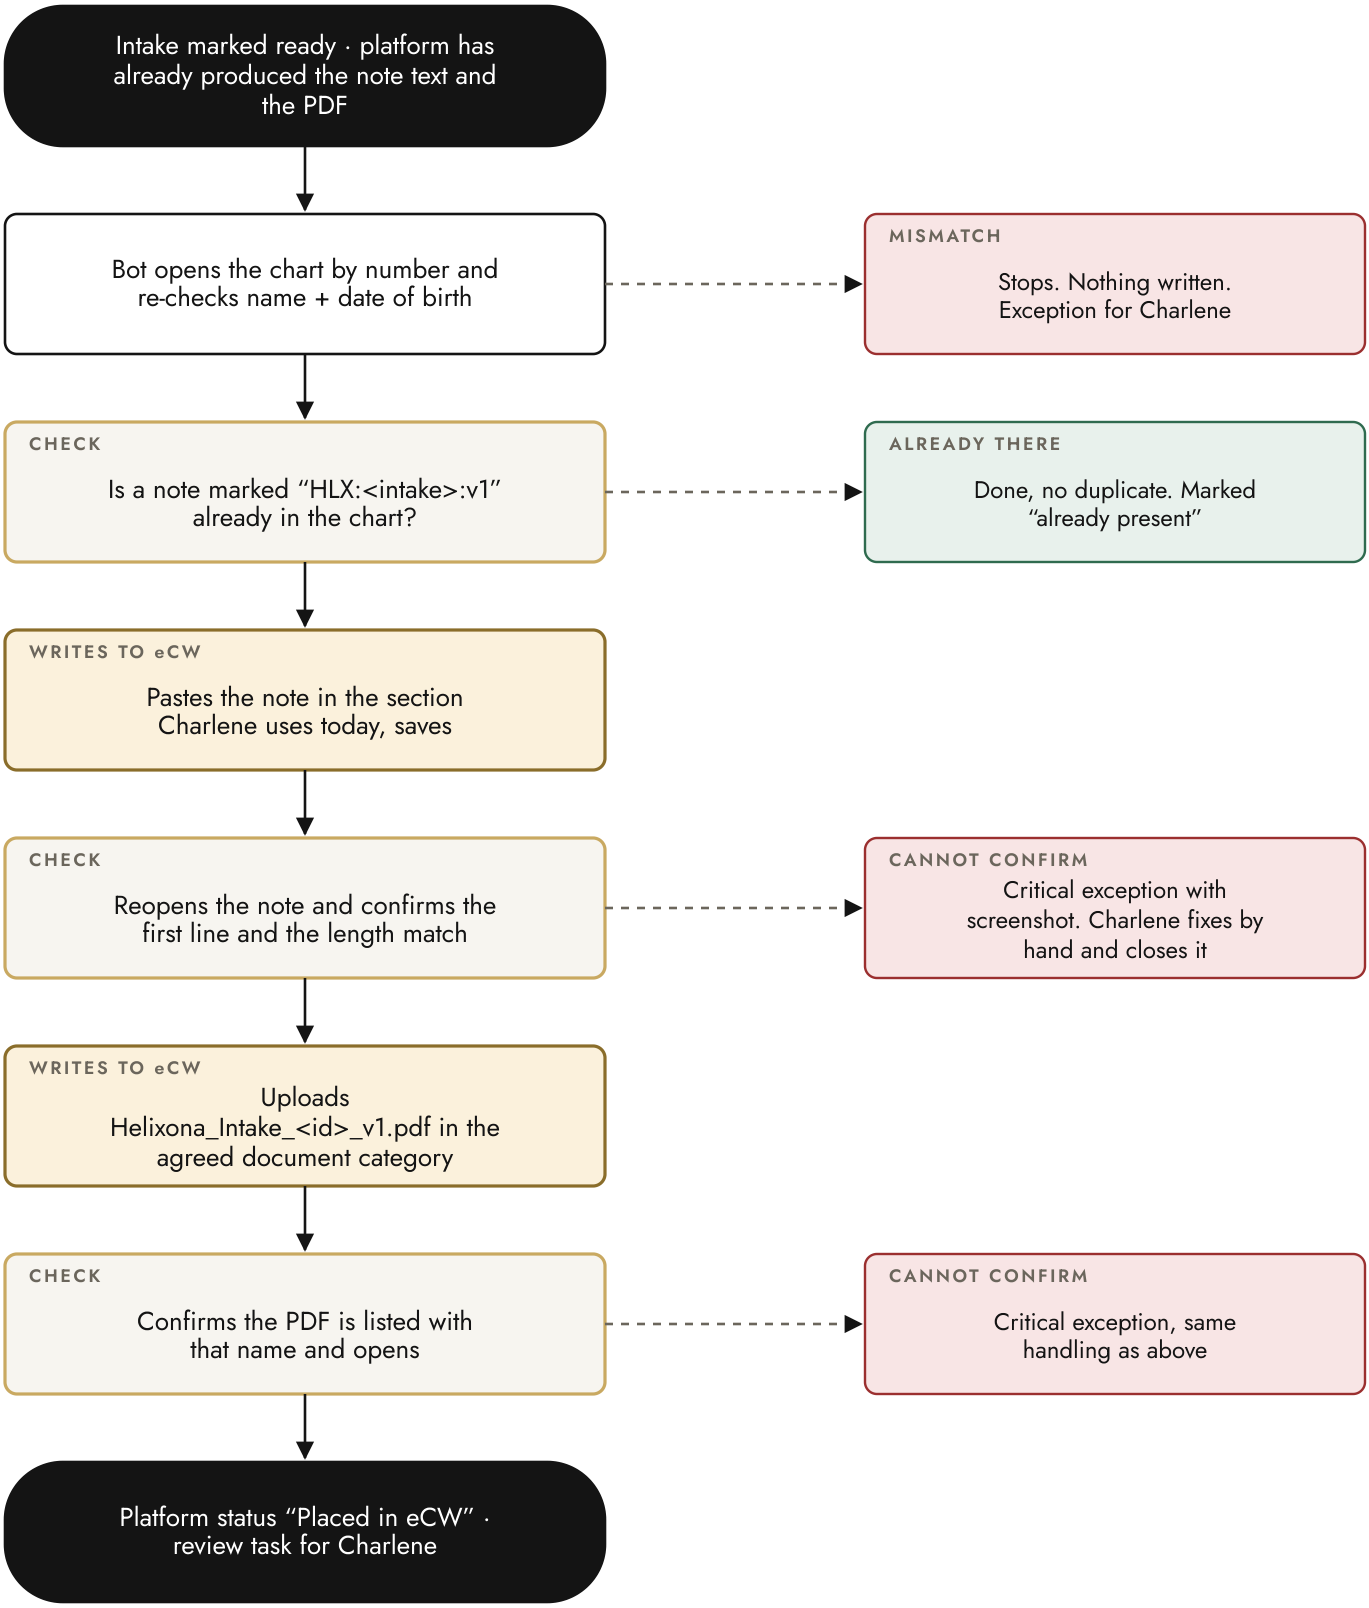

Most mistakes in the chart come from a wrong or missing chart number. J1 catches that before anything is written.

J2 Intake note and PDF into the chart

WRITES — When Charlene marks an intake "ready for chart prep"

Today Charlene copies the intake by hand. J2 places the formatted note and the PDF exactly where she does, then checks its own work.

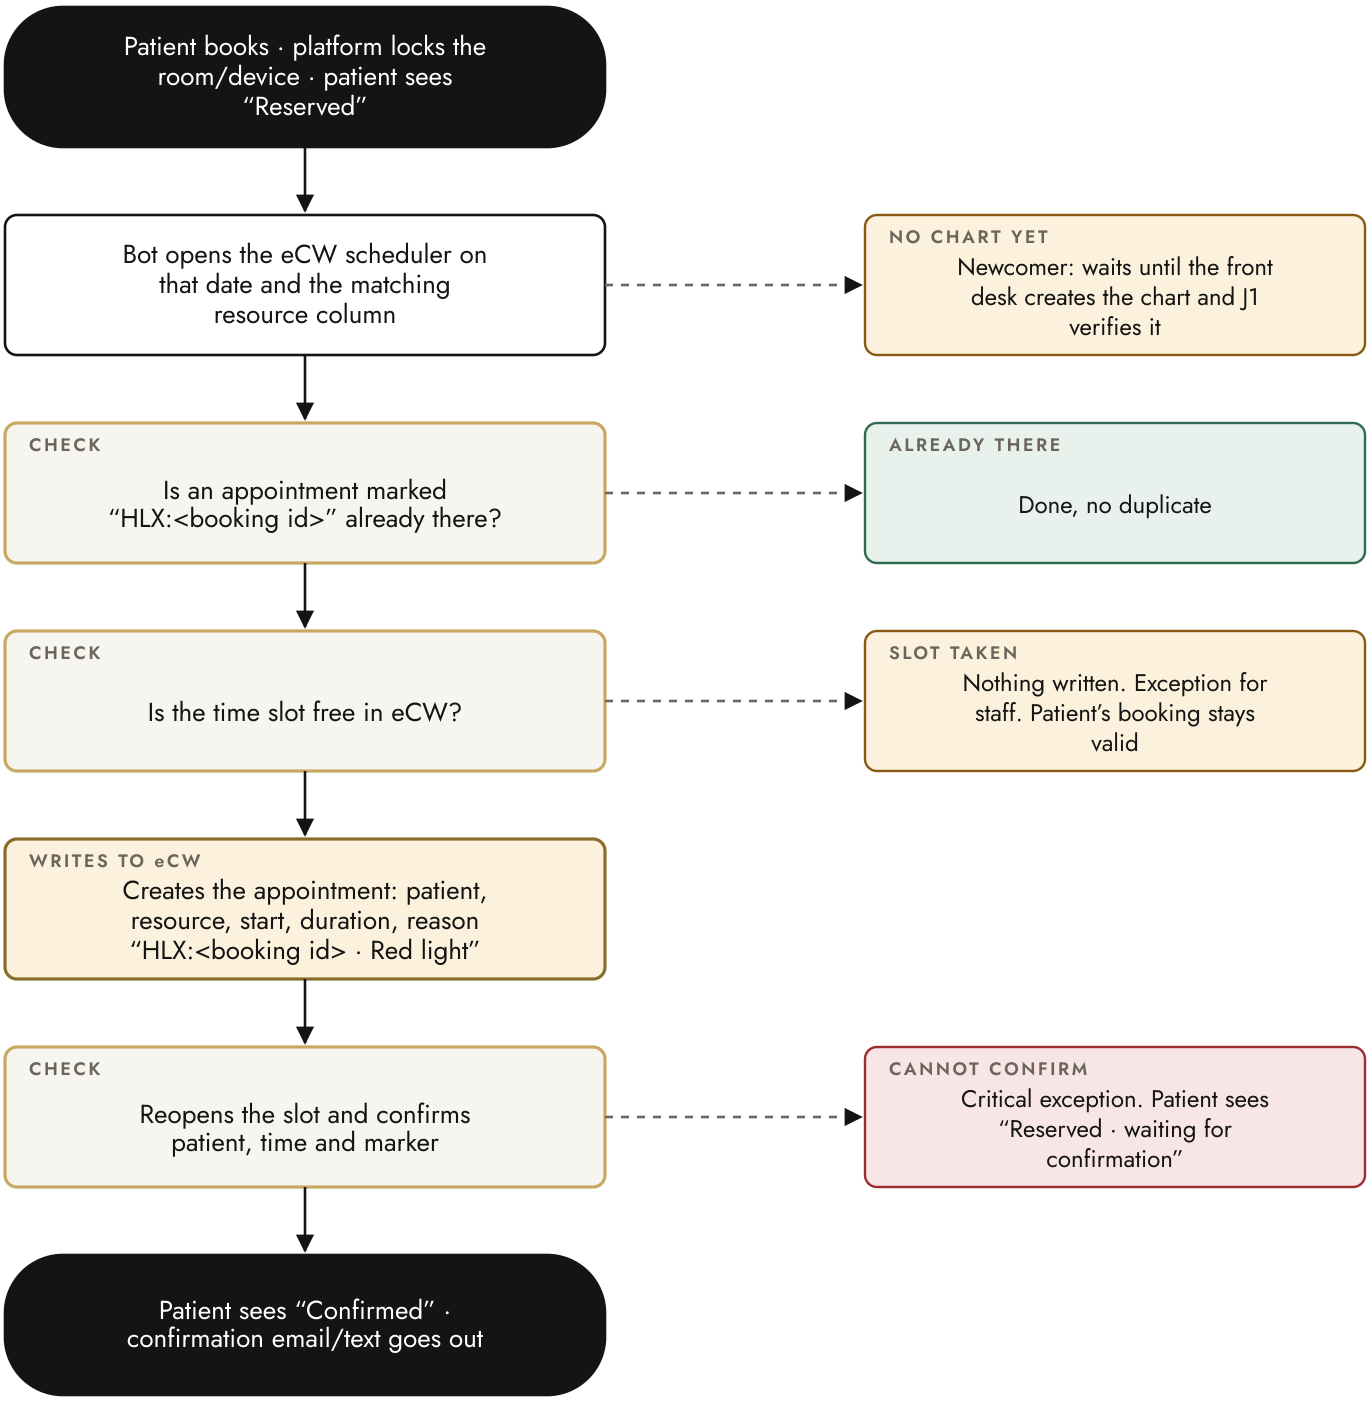

J3

Appointment mirror

WRITES When the platform confirms a program session or a paid treatment booking

The platform owns the room or device and the booking. eCW gets a copy so the front desk sees one calendar.

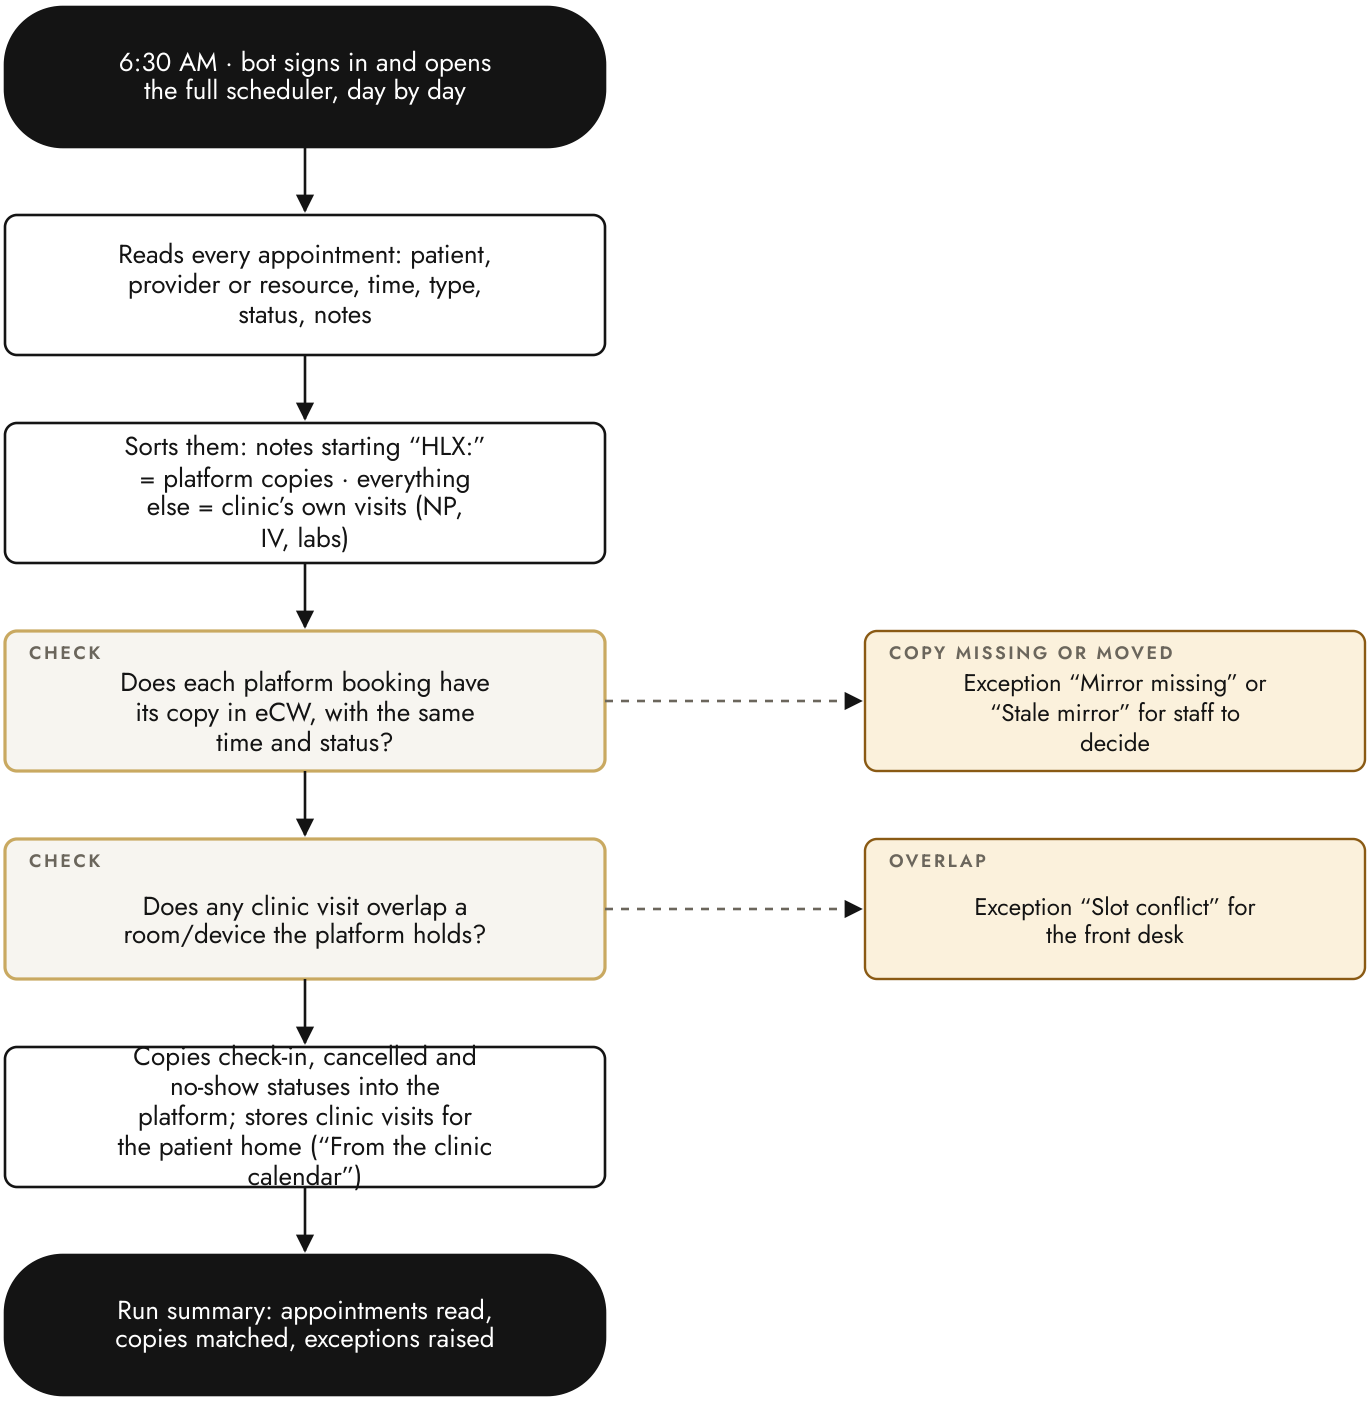

J4

Morning schedule read

READS ONLY Every day at 6:30 AM for the next 14 days, and on demand from the staff calendar

The safety net. It finds anything that humans or the other jobs did differently, and brings insurance visits into the patient's app read-only.

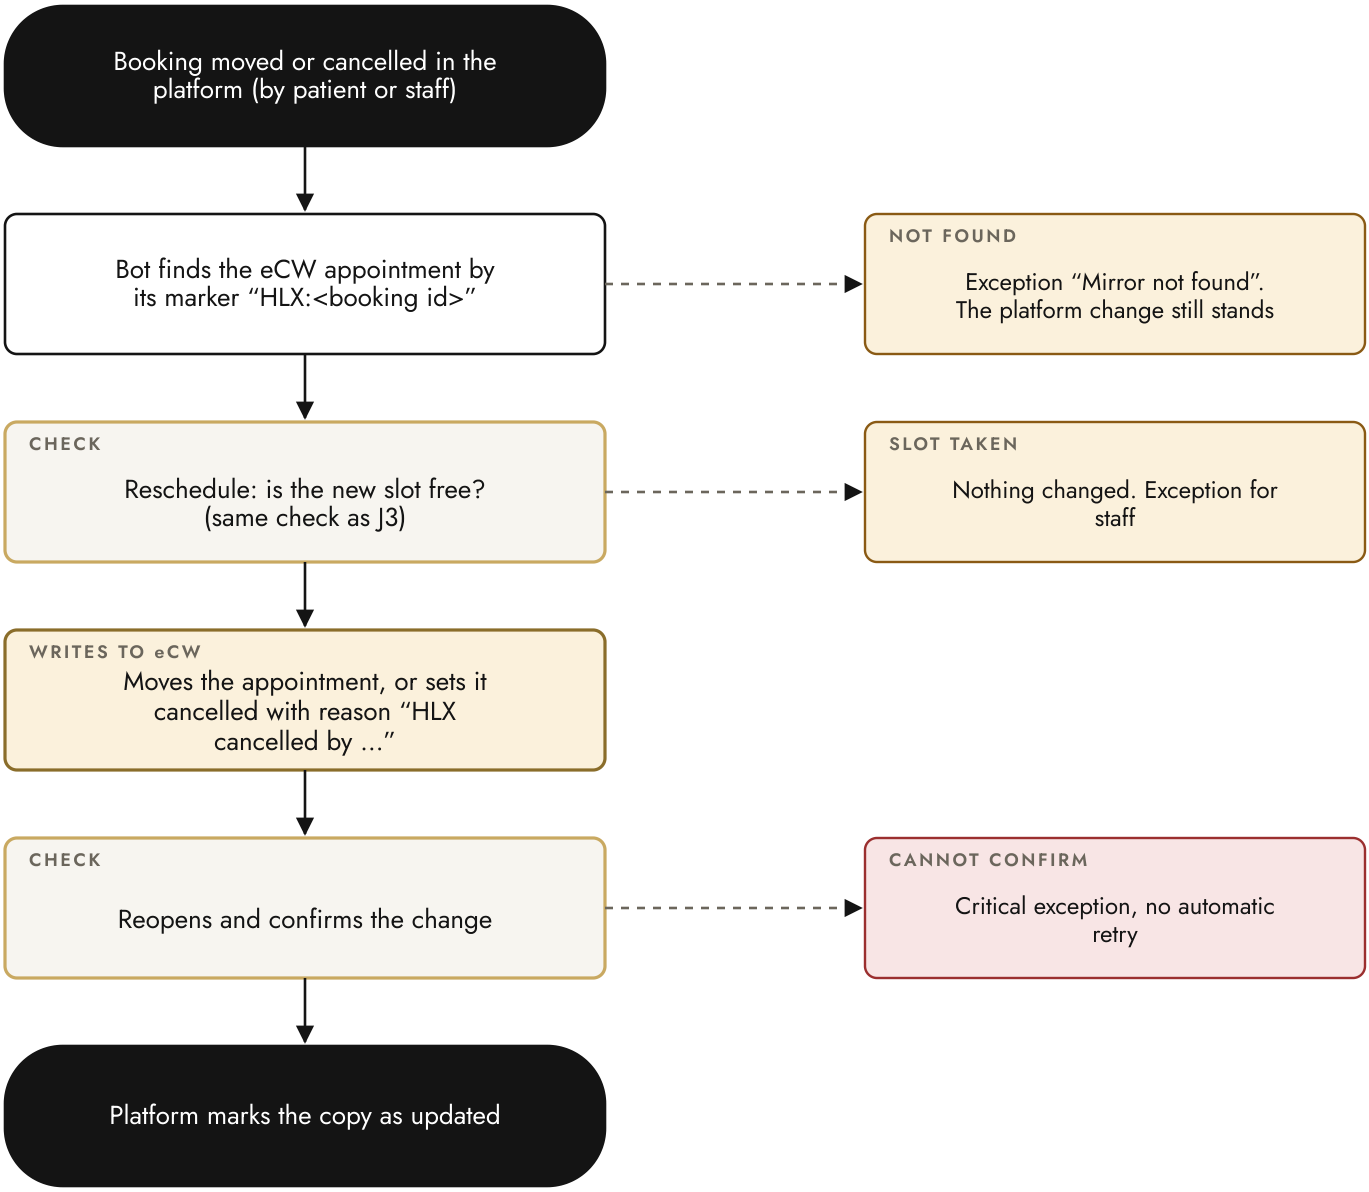

J5

Reschedule or cancel mirror

WRITES When a confirmed platform booking is moved or cancelled

Keeps the eCW copy in step with the platform without ever touching appointments humans created.

FOR THE MEETING

What we need to settle with Kai

Access

A bot user in eCW with the minimum rights, and a test patient chart ("Test, HLX").

Which eCW

Web client or desktop client. It changes the tooling, not these flows.

Charlene's screen share

30 minutes recording exactly where she pastes the intake note and which document category she uses (J2).

Rooms and devices

Visit types

Order of delivery

Do they exist in eCW as resources today, or only providers? (J3, J4)

Which appointment type to use for program sessions and for treatment-only bookings.

J1 and J2 first (intake is the first module), then J3 and J5, then J4.

Acceptance for each job is simple: run it twice with the same input and get one result in eCW; break the confirmation step on purpose and see the item land in the staff exception queue with a screenshot.
